

Hang Your Glass

PRECISE VERSATILE **STURDY**

Question: How can I be sure the Hang Your glass adhesive is going to be stronger than the glass?

Answer: We encourage every user especially new users to test their application. This will ensure that you are properly affixing the metal to the glass and it will give you confidence of just how strong the Hang Your Glass adhesive is.

Enclosed is a finished metal sample to test your adhesive application.

Follow the adhesive instructions on the back of the package. Hang Your Glass recommends using 100% Acetone to clean the metal and the glass for the strongest application.

Attach glass to both sides of the metal, you will have two test samples. The adhesive sets in 5-10 minutes, cures in 48-72 hours. It is best to do this in a room temperature environment, do not apply direct heat to speed up the set or the cure time.

For the best presentation, use your 100% acetone to clean up around the stand-off with in 30 minutes of the set time. This adhesive begins to set and cure in the absence of air therefore any adhesive remaining around the stand-off will not cure and will be tacky.

After the adhesive has cured then try to break the adhesive bond from the glass to metal. If your application is correct the glass will not detach from the metal!

Keep your sample to show clients just how strong the adhesive is!
